DESCRIPTION

The DS9104 Digital Decoder Ring brings jewelry into the information age. In its custom-designed setting it holds a Memory iButton with a unique, 64-bit serial number permanently engraved into the silicon chip inside plus 64K-bit of nonvolatile SRAM for virtually unlimited read and write cycles. For technical details on iButtons please refer to the Automatic Identification Data Book.

Applications of the Digital Decoder Ring include access control to buildings, personal information such as medi-

cal records, business card data, private address, telephone list and access control to computers. Under iButton TMEX, files for all applications can reside in the same device without disturbing each other. The memory chip is formatted like a floppy disk and maintains a directory of files for random access.

Adapters for reading and writing iButtons through the parallel or serial port of IBM-compatible computers, the TMEX operating system and the Priva-C™ PC security system can be ordered for immediate shipment.
